# I. Summary and Highlights

This report presents Ontario Ministry of Finance population projections for Ontario and each of its 49 Census Divisions from the base year of 2004 to 2031.

The Ministry produces detailed population projections for the 30-year period following every Census, in this case the 2001 Census. The Ministry first released a report on Ontario-level projections from 2004 to 2031, based on the 2001 Census, in November 2004. That report has now been updated to include projections at the Census Division level which are consistent with the Ontario-level projections released in November 2004. These projections replace Census Division-level projections for Ontario produced by the Ministry of Finance following the 1996 Census

It should be noted that these population projections do not represent Ontario Government policy targets or desired population outcomes; nor do they incorporate explicit economic assumptions. The projections are developed to provide to Ontario ministries, municipalities and other interested users an outlook of population growth for Ontario and its 49 Census Divisions based on a standard demographic methodology. The Ministry's demographic assumptions for growth reflect past trends in all streams of migration and the continuing evolution of long-term fertility and mortality patterns in each Census Division. Population is projected for each of the 49 Census Divisions and summed to an Ontario total.

Three projection scenarios are provided for Ontario. The medium or reference scenario is considered "most likely" to occur. The low- and high-growth scenarios provide a reasonable forecast range based on plausible changes in the components of growth. At the Census Division level, a medium-growth scenario is provided that corresponds to the medium-growth scenario for Ontario.

The base population for Ontario and its 49 Census Divisions used in the projections is taken from the preliminary July 1, 2004 postcensal estimates, first released by Statistics Canada in September 2004 for Ontario and in November 2004 for Census Divisions. For Ontario, this base was 12.39 million.

Highlights of the projections (reference scenario unless otherwise stated) are presented below:

Ontario's population is projected to experience fairly robust growth over the projection period under all three scenarios.

- The population of Ontario in the reference scenario is projected to grow by 32.6 per cent or 4 million from an estimated 12.39 million on July 1, 2004 to 16.43 million on July 1, 2031. The population reaches 14.5 million under the low-growth scenario and almost 18 million under the high-growth scenario by 2031.
- During the first 10-year period, the annual rate of growth averages 1.2 per cent compared to 1.4 per cent during the previous decade. Over the full projection period, the annual rate of population growth declines, from 1.3 per cent in the first year of the projections to 0.7 per cent by the year 2030-31.
- The number of births, projected to be 130,000 in the first year, increases gradually to reach 157,000 in 2024-25. The increase in births is due to more women of child-bearing age and to the slightly increasing fertility rates assumed in the reference scenario. The annual number of births starts to decline slowly in 2025-26 to reach 155,000 at the end of the projection period. The total fertility rate is assumed to increase slightly from 1.48 in 2004-05 to 1.53 by 2011 and to remain constant for the rest of the projection period.
- The number of deaths continues to increase as baby boomers age. From 82,000 in the first projected year, the annual number of deaths reaches 136,000 by the end of the projection period.
- Over the first decade, when the number of births and deaths increases at about the same pace, natural increase remains roughly constant at about 48,000. Over the rest of the projection period, natural increase declines rapidly, as deaths rise faster than births, dropping to just over 19,000 by 2030-31. In the low scenario, a pattern of natural decrease (more deaths than births) occurs starting in the year 2024-25. In the high scenario, natural increase rises rapidly until 2022-23 and declines slowly thereafter.
- Over the decade 2004-2014, net migration adds 1.1 million to the population of Ontario, accounting for 70 per cent of total population increase. Over the full projection period, net migration will account for 72 per cent of total population growth. Immigration is by far the largest component of net migration.
- The median age of Ontario's population will rise to 43 years in 2031, from 38 years in 2004. The median age for women climbs from 39 to 44 years, and the median age for men increases from 37 to 42 years.
- The population age 65 and over more than doubles from 1.6 million or 12.8 per cent of the population in 2004 to 3.6 million or 22.2 per cent in 2031. The population age 75 and over will more than double as well, increasing from 731,000 or 5.9 per cent of the population in 2004 to 1.7 million or 10.1 per cent in 2031. The growth in seniors' share of the population will accelerate after 2011 as baby boomers begin to turn age 65. This same cohort will begin to reach age 75 a decade later, in 2021.

- The number of children under age 15 rises by only 253,000 over the projection period, from 2.3 million to 2.5 million, while their share of the population falls from 18.5 per cent in 2004 to 15.5 per cent in 2031.
- The core working-age population, ages 15-64, is projected to increase by 20 per cent, from 8.5 million in 2004 to 10.2 million by 2031. Within this age group, the most rapid increase is among those over age 45. The share of the core working age population will rise gradually from 68.8 per cent in 2004 to peak at 69.6 per cent in 2010, after which it will fall slowly to 62.4 per cent by 2031.
- The overall dependency ratio, the ratio of the 0-14 and the 65+ age groups to the 15-64 age group, remains favourable until 2010, falling gradually from 45 "dependants" for every 100 working-age individuals in 2004 to 44 "dependants" in 2010. The favourable pattern of low dependency ratios will begin to change after 2010 with the arrival of large cohorts of baby boomers in the group age 65 and over. The dependency ratio will climb to 60 "dependents" by the year 2031.
- Not all regions of Ontario are projected to experience the same rate of population growth. The Greater Toronto Area (GTA), comprised of the City of Toronto and the regional municipalities of Durham, Halton, Peel and York, will be by far the fastest-growing region. It is projected to grow from 5.7 million in 2004 to 8.1 million in 2031. The GTA's share of total Ontario population will rise from 45.6 per cent in 2004 to 49.5 per cent in 2031, or almost one-half of Ontario's population. The GTA's share of net Ontario population growth to 2031 is projected to be 61.5 per cent. International migration is a very significant factor in the projected increase in the GTA's population and share.
- Within the GTA, Toronto's population is forecast to increase from 2.6 million in 2004 to 3.1 million in 2031. Growth in the other regions of the GTA (Durham, Halton, Peel and York) will add about 2 million people to the GTA. Within the GTA, only Toronto is projected to grow at a slower pace (19 per cent) than Ontario as a whole; Durham, Halton, Peel and York are projected to grow by 50 per cent or more over the period.
- The population of Central Ontario is projected to grow from 2,711,000 in 2004 to 3.570,000 in 2031. The region's share will remain essentially unchanged at about 22 per cent. Many Census Divisions surrounding the GTA (Simcoe, Dufferin, Wellington and Waterloo) are projected to continue to experience above-average population growth.
- The population of Eastern Ontario is projected to grow from 1,647,000 to 2,077,000 over the projection period. Ottawa is projected to grow fastest, above the provincial average, from 830,000 in 2004 to over 1.1 million in 2031. The rest of Eastern Ontario will experience growth below the provincial average, with Lanark and Frontenac growing fastest.

- The population of Southwestern Ontario is projected to grow from 1,569,000 in 2004 to 1,905,000 in 2031. Growth rates within Southwestern Ontario will vary, with Essex growing fastest, above the provincial average, and Lambton and Chatham-Kent seeing the least growth.
- The population of Northern Ontario is projected to decline by 8.5 per cent over the period, from 810,000 in 2004 to 741,000 in 2031. This projected decline reflects Northern Ontario's recent migration trends and age structure. Among northern Census Divisions, Timiskaming and Cochrane are projected to experience the most population decline, and Parry Sound is projected to experience the most growth.

# II. Introduction

This report presents population projections for Ontario and each of its 49 Census Divisions (i.e., regional municipalities, counties and districts), by age and sex, from the base year of 2004 to 2031.\*

The Ministry of Finance produces detailed population projections for the 30-year period following every Census, in this case the 2001 Census. The Ministry first released a report on Ontario-level projections from 2004 to 2031, based on the 2001 Census, in November 2004. That report has now been updated to include projections at the Census Division level which are consistent with the Ontario-level projections released in November 2004 .\*\* These projections replace Census Division-level projections for Ontario produced by the Ministry of Finance following the 1996 Census.

It should be noted that these population projections do not represent Ontario Government policy targets or desired population outcomes; nor do they incorporate explicit economic assumptions. The projections are developed to provide to Ontario ministries, municipalities and other interested users an outlook of population growth for Ontario and each of its 49 Census Divisions based on a standard demographic methodology. The Ministry's demographic assumptions for growth reflect past trends in all streams of migration and the continuing evolution of long-term fertility and mortality patterns in each Census Division.

Statistics Canada's July 1, 2004 preliminary postcensal population estimates, released for Ontario in September 2004 and for Census Divisions in November 2004, are the base for the projections. For Ontario, this base was 12.39 million.

The technique used is the cohort-component method. The modelling begins with the population estimates by age and sex in the base year of 2004. The population is "aged" one year at a time, with assumed fertility and mortality rates generating births and deaths in each year. Additional assumptions generate the annual level and the age-sex composition of each of five migration components (immigration, net emigration, net change in Non-permanent Residents, interprovincial in- and out-migration and intraprovincial in- and out-migration). This methodology is applied and the population is projected for each of the 49 Census Divisions. These populations are then summed to an Ontario total.

<sup>\*</sup> Draft projections were sent out to key stakeholders for a technical consultation in July 2004. At that time, the base year was 2003. To keep the projections up-to-date, they are now based on 2004 population. The new base provided a higher starting point and minor adjustments were made to assumptions reflecting the most recent trends.

<sup>\*\*</sup> The methodology used for Census Division-level projections in which the Ontario total is derived from the sum of all 49 Census Divisions results in slight but insignificant differences over time in the age structure, number of births and total population for Ontario compared to the November 2004 report.

Three projection scenarios for Ontario provide a reasonable forecast range. At the Census Division level, a medium-growth scenario is provided that corresponds to the medium-growth scenario for Ontario.

The following part of this report (See III. Projection Results) provides a discussion of projection results, including Ontario population under reference, low- and high-growth scenarios; a discussion of the components of Ontario's population growth; Ontario age structure; and regional population growth and age structure. The next section of the report (See IV. Methodology and Assumptions) provides a description of the methodology and the assumptions underlying each scenario.

The last part of the report is a detailed Statistical Appendix of the most commonly used tables.

# III. Projection Results

## Reference, Low and High Scenarios

The projections provide a range of plausible growth scenarios for the population of Ontario over the next three decades.

The medium-growth or reference scenario is considered "most likely" to occur. It combines a slightly increasing fertility level to 2011, a moderate decline in mortality and a slowly declining net migration level.

The low-growth scenario is based on a declining fertility rate and, compared to the reference scenario, a slower decline in mortality and a lower net migration level.

The high-growth scenario combines an increasing fertility assumption and, compared to the reference scenario, a faster decline in mortality and a higher net migration level.

In all three scenarios, Ontario's population is projected to experience fairly robust growth over the projection period. From the 12.39 million estimated as of July 2004, the population of Ontario is projected to reach 16.43 million in the reference scenario, a growth of 32.6 per cent. The population is projected to grow to 14.5 million in the low-growth scenario, and to almost 18 million in the high-growth scenario.

The increase in population over the whole projection period amounts to 4 million in the reference scenario, 2.1 million in the low-growth scenario and 5.6 million in the high-growth scenario.

Over the projection period, the rate of population growth will decline in the reference scenario from 1.3 per cent in the first year to 0.7 per cent in the last year. The rate of growth in 2030-31 is 0.2 per cent in the low scenario and 1.1 per cent in the high scenario.

During the first 10-year period, the annual rate of growth in the reference scenario averages 1.2 per cent compared to an average of 1.4 per cent during the previous decade. The average annual rate of growth is projected to slow to 1 per cent in the second decade and 0.8 per cent in the rest of the projections period. In the low scenario, the annual rate of growth averages 0.8 per cent in the first decade, 0.6 per cent in the second decade and 0.3 per cent in the remainder of the projections. Similarly, annual rates of growth under the high scenario assumptions are 1.5 per cent, 1.4 per cent and 1.2 per cent respectively for the same periods.

# The Components of Population Change

Diminishing natural increase is the main factor contributing to a slowing rate of population growth over the projection period. This is the consequence of several decades of declining fertility and the arrival of large cohorts of baby boomers at older ages (more deaths).

The number of births, projected to be 130,000 in the first year of the projections, increases gradually to reach 157,000 in 2024-25. The increase in births is due to more women of childbearing age and to the slightly increasing fertility rates assumed in the reference scenario. The annual number of births starts to decline slowly in 2025-26 to reach 155,000 at the end of the projection period. Under the declining fertility assumption (low scenario), births decrease to 115,000 at the end of the projection period while births increase to 191,000 under the high fertility assumption.

The annual number of deaths will continue to increase as baby boomers age. From 82,000 in the first year of the projections, the number of deaths reaches 136,000 annually by the end of the projection period in the reference scenario and 143,000 and 126,000 in the low and high scenarios respectively.

Over the first decade, when the number of births and deaths increases at about the same pace, natural increase remains roughly constant at about 48,000. Over the rest of the projection period, natural increase declines rapidly, as deaths rise faster than births, dropping to just over 19,000 by 2030-31. In the low scenario, a pattern of natural decrease (more deaths than births) occurs starting in the year 2024-25. In the high scenario, natural increase rises rapidly to reach 74,000 in 2022-23 and declines slowly thereafter to 65,000 by 2030-31.

Migration is a very significant contributor to the demographic growth of Ontario. Over the first decade of the projections, 2004-2014, net migration will add more than 1.1 million to the population of Ontario, accounting for 70 per cent of total population increase in the reference scenario. Over the full projection period, in the reference scenario, net migration will account for 72 per cent of total population growth and add over 2.9 million people to Ontario's population. Over this same period, Ontario gains 3.8 million people in the high scenario and less than 1.8 million people in the low scenario as a result of net migration. Immigration is by far the largest component of net migration.

# **Age Structure**

Over the projection period, the age structure of Ontario's population will change, with a shift to more seniors.

The population age 65 and over will rise significantly, from 1.6 million or 12.8 per cent of the population in 2004 to 3.6 million or 22.2 per cent in 2031. In the low-growth scenario, this age group will rise to 3.5 million or 23.8 per cent of the population in 2031, and in the high-growth scenario, to 3.9 million or 21.6 per cent. The population age 75 and over will more than double and increase from 731,000 or 5.9 per cent in 2004 to 1.7 million or 10.1 per cent in 2031. In the low-growth scenario, this age group will rise to 1.6 million or 10.8 per cent of the population in 2031, and in the high-growth scenario, to 1.8 million or 10.1 per cent. The growth in seniors' share of the population will accelerate after 2011 as baby boomers begin to turn age 65. This same cohort will begin to turn age 75 a decade later, in 2021.

By contrast, the number of children under age 15 will rise by only 253,000 in the reference scenario, from 2.3 million in 2004 to 2.5 million in 2031, while their share of the population will fall from 18.5 per cent to 15.5 per cent. In the low-growth scenario, the number of children under age 15 falls below 2 million by 2031, reflecting the declining fertility rate, and their share falls to 13.6 per cent by 2031. Given the increasing fertility assumption in the high-growth scenario, the number of children increases to 3 million and their share falls to 16.7 per cent by 2031.

The core working-age population, ages 15-64, increases by 20 per cent in the reference scenario, from 8.5 million in 2004 to 10.2 million by 2031. Within this group, the most rapid increase is for the age group 45-64. The share of the population that is of core working age will rise gradually from 68.8 per cent in 2004 to peak at 69.6 per cent in 2010, after which it will fall slowly to 62.4 per cent by 2031. In the low- and high-growth scenarios, the core working-age population will rise to 9.1 million and 11.1 million respectively by 2031 and will comprise about 62 per cent and 63 per cent of the population, roughly the same as in the reference scenario.

The median age of Ontario's population will rise to 43 years in 2031, from 38 years in 2004. The median age for women will climb from 39 to 44 years. The median age for men will increase from 37 to 42 years. Under the low- and high-growth scenarios, the median age of Ontario's population will rise to 45 and 42 years respectively by 2031.

At older ages, the number of women will continue to exceed the number of men because of the higher life expectancy of women. Currently, there are 64 males per 100 females among those age 75 and over. By 2031, there will be 80 males per 100 females. The ratio will increase because of the assumption of a narrowing gap between male and female life expectancies underlying these projections.

Under all three scenarios, the overall dependency ratio, the ratio of the 0-14 and the 65+ age groups to the 15-64 age group, remains favourable (i.e., low) until 2010. In 2004, there were 45 "dependants" (ages 0-14 and 65+) for every 100 working-age individuals. By 2010, this dependency ratio is projected to decline to 44. This pattern of low dependency ratios will begin to change after 2010 with the arrival of large cohorts of baby boomers in the group age 65 and over. By the year 2031, the dependency ratio will have climbed to 60, similar to the early 1970s. However, this time it will be the increasing seniors population, rather than the number of children, that will be the driving force behind the rising dependency ratio.

## **Regional Population Growth**

Within Ontario, the main demographic determinants of regional population growth are the current age structure of the population, natural increase, and the migratory movements in and out of each region.

The current regional age structure has a direct impact on projected births and deaths – natural increase. A region with a higher share of its current population in older ages will likely experience more deaths in the future than a region of comparable size with a younger population. Similarly, a region with a large share of young adults in its population is expected to see more births proportionately than a region of comparable size with an older age structure. Also, since migration rates vary not only by region and Census Division but also by age, the age structure of a region or Census Division will have an impact on the migration of its population.

Natural increase is projected to contribute positively to population growth over the projection period as a whole in all regions other than Northeastern Ontario, where natural increase is already negative and is projected to decline further. However, the general aging of the Ontario population means that natural increase will decrease over the period in all regions and, except in the Greater Toronto Area (GTA), will actually turn negative in the last few years of the projections. This declining or negative trend in natural increase means that many Census Divisions in Ontario where natural increase used to be the main if not the sole contributor to population growth have already started to see their population growth slow, a trend that is projected to continue as the population ages further.

Migration is the most important determinant of population growth for Ontario as a whole and for most regions. Net migration gains whether from international sources, other parts of Canada or other regions of Ontario, are projected to be the major source of population growth for almost all regions. Large urban areas such as the GTA which receive most of the international migrants to Ontario are projected to grow strongly. For other regions such as Central Ontario, the continuation of migration gains from other parts of the province will be a key source of growth. Other areas such as some Census Divisions of Northern Ontario receive only a small share of international migration and have been experiencing net youth out-migration which reduces both current and future population growth.

The GTA, comprised of the City of Toronto and the regional municipalities of Durham, Halton, Peel and York, is projected to be by far the fastest-growing region, at 43.9 per cent over the period compared to 32.6 per cent for all Ontario. Its population is projected to increase from 5.7 million in 2004 to 8.1 million in 2031. The GTA's share of total Ontario population will rise from 45.6 per cent in 2004 to 49.5 per cent in 2031, or almost one-half of Ontario's population in 2031. The GTA's share of Ontario's net growth to 2031 is projected to be 61.5 per cent. International migration into the GTA is a very significant factor in the projected increase in the GTA's population and share.

Within the GTA, Toronto's population is projected to increase from 2.6 million in 2004 to 3.1 million by 2031. Growth in Durham, Halton, Peel and York will add about 2 million people to the GTA over the projection period. Only Toronto is projected to grow at a slower pace (19 per cent) than Ontario as a whole. The other GTA Census Divisions are projected to experience very strong growth of 50 per cent or higher over the period, with York growing the fastest.

The population of Central Ontario is projected to grow from 2,711,000 in 2004 to 3,570,000 in 2031 or by 31.7 percent. The region's share of Ontario's population will remain essentially unchanged at about 22 per cent. Many Census Divisions surrounding the GTA will continue to experience above-average population growth, ranging from 33.4 per cent in Waterloo, 37.3 per cent in Wellington, 48.5 per cent in Dufferin to 59.7 per cent in Simcoe.

The population of Eastern Ontario is projected to grow from 1,647,000 to 2,077,000 over the projection period or by 26.1 per cent. Ottawa is projected to grow fastest (34.6 per cent) from 830,000 in 2004 to 1,117,000 in 2031. The rest of Eastern Ontario will experience growth below the provincial average, with Lanark and Frontenac growing fastest at 27.9 and 24.7 per cent respectively.

The population of Southwestern Ontario is projected to grow from 1,569,000 in 2004 to 1.905,000 in 2031 or by 21.4 per cent. Growth rates within Southwestern Ontario will vary, with Essex growing fastest, above the provincial average, and Lambton (3.3 per cent) and Chatham-Kent (0.6 per cent) seeing the least growth.

The population of Northern Ontario is projected to decline from 810,000 in 2004 to 741,000 by 2031, a decline of 8.5 per cent. In the past, Northern Ontario's positive natural increase offset part of the losses it experienced through net migration. However, in this demographic projection, natural increase in the North is now projected to become negative due to population aging. Seven of eleven Census Divisions in the North are projected to decline, with Timiskaming and

Cochrane projected to experience the most population decline. The Census Divisions of Parry Sound, Manitoulin, Nipissing and Kenora are projected to grow.

## **Regional Age Structure**

All regions will see a shift to an older age structure. Regions where natural increase and net migration are projected to become or remain negative will see the largest shifts.

The GTA is expected to remain the region with the youngest age structure as a result of strong international migration and positive natural increase. Median age in the GTA will increase from 36.4 years in 2004 to 41.1 years in 2031. By contrast, the Northeast will remain the region with the oldest age structure, with median age rising from 41.0 years in 2004 to 50.6 years in 2031. In the other regions, median age is projected to reach about 45 years by 2031.

In 2004, the share of seniors (age 65+) in the population of each region ranged from 11.2 per cent in the GTA to 15.3 per cent in the Northeast. By 2031, seniors will account for 18.9 per cent of the population in the GTA and 31.5 per cent in the Northeast. Similarly, seniors' share of the population will increase from 14.2 per cent to 25.3 per cent in Central Ontario, from 13.4 per cent to 24.7 per cent in the East, from 14.1 to 24.6 per cent in the Southwest, and from 13.1 per cent to 26.4 per cent in the Northwest.

The share of population of core working age (15-64), which ranged from 67.4 per cent in Central Ontario to 70 per cent in the GTA in 2004, is projected to decline over the projection period in every region. This age group is projected to account for 64.8 per cent of population in the GTA and 59.9 per cent in Central Ontario by 2031. The Northeast will see the largest decline in the share of its population age 15-64, from 67.7 per cent to 55.9 per cent. The share of this age group will also fall from 68.9 per cent to 61 per cent in the East, from 67.4 per cent to 60.2 per cent in the Southwest, and from 67.6 per cent to 57.8 per cent in the Northwest.

Similarly, the share of children under age 15 in the total population of every region is projected to decline over the projection period, especially in the first decade. In 2004, the Northwest, with its relatively higher fertility rate, was the region with the highest share of children 0-14, at 19.3 per cent. By contrast, the Northeast was the region with the lowest share of children, at 17 per cent. By 2031, children aged 0-14 are projected to account for 12.6 per cent of the population of the Northeast and 15.8 per cent of the population of the Northwest. For other regions, shares will decline between 2004 and 2031 from 18.8 per cent to 16.3 per cent in the GTA, from 18.4 per cent to 14.8 per cent in Central Ontario, from 17.7 per cent to 14.4 per cent in the East, and from 18.5 per cent to 15.3 per cent in the Southwest.

The share of youth aged 18-24 is also projected to decline in every region over the projection period. In 2004, all regions had fairly similar shares of youth in their population. The Southwest had the highest share at 10 per cent while Eastern Ontario had the lowest at 9.4 per cent. By 2031, youth will account for 7.7 per cent of population in the Southwest and 7.2 per cent in the East. The share of youth will also decline from 9.5 per cent in the GTA in 2004 to 8.2 per cent in 2031, from 9.5 per cent to 7.3 per cent in Central Ontario, from 9.4 per cent to 6.6 per cent in the Northeast, and from 9.8 per cent to 7.4 per cent in the Northwest.

# IV. Methodology and Assumptions

## **Projections Methodology**

The methodology used in these long-term population projections is the cohort-component method. The methodology is basically a demographic accounting system. The calculation starts with the base-year population (2004) distributed by age and sex.

A separate analysis and projection of each component of population growth is made each year, starting with births. Then, deaths and the five migration components (immigration, net emigration, net change in Non-permanent Residents, interprovincial in- and out-migration, and intraprovincial in- and out-migration) are also generated and added to the population cohorts to obtain the population of the subsequent year, by age and sex.

This step is done first for each of the 49 Census Divisions. The Ontario population is then obtained by summing the projected Census Division populations.

It should be noted that the population projections are demographic, based on assumptions about births, deaths and migration over the projection period. Assumptions are based on analysis of past trends of these components and expectations of future direction. For Ontario, the degree of uncertainty inherent in projections is represented by the range between the low- and high-growth scenarios, with the medium or reference scenario representing the most likely outcome.

#### **Base Population**

The base population is the preliminary postcensal estimate (i.e., post-2001 Census) for each Census Division, by age and sex, estimated by Statistics Canada for July 1, 2004. The 2004 estimates at the Census Division level used in these projections were released by Statistics Canada in November 2004.

#### **Component Assumptions**

Assumptions for each component of population growth — births, deaths and migration — were first developed at the provincial level. Then, assumptions specific to each Census Division were determined.

## **Fertility**

The projected number of births for any given year is obtained by applying age-specific fertility rates to cohorts of women in the reproductive age group, ages 15 to 49. The projection model relies on a four-parameter Pearsonian curve to generate the annual number of births. The first of these parameters, the Total Fertility Rate (TFR), reflects the level of fertility while the other three parameters (the mean age at fertility, the skewness and the variance of the distribution) reflect the timing, or age, at which women have their babies. All parameters used are calibrated to generate age-specific fertility rates that closely follow recent trends.

Assumptions were based on a careful analysis of past age-specific fertility trends in Ontario and a review of fertility trends elsewhere in Canada and in other countries. The generally observed trends over the past 25 years are that women are having fewer children and are postponing births to later in life.

The decline in the fertility rate among young women is accompanied by a rise in fertility rates among older women. Recently, teenage girls and women in their early 20s have experienced the sharpest declines in fertility rates. Women in their late 20s and early 30s have had declining fertility rates over the late 1990s but recent data point toward a stabilization. Fertility rates of women in their mid-30s and older are rising.

#### **Total Fertility Rate**

Following about half a century of almost continuous decline, the Total Fertility Rate (TFR) in Ontario has recently reached the lowest level ever recorded for the province: 1.48 children per woman in 2002. This is less than half the level at the peak of the Baby Boom (in 1960) when Ontario's total fertility rate reached 3.8 children per woman with a record 159,000 births registered that year. In 1972, fertility crossed the replacement level of 2.1 children per woman.

Most researchers agree that fertility levels in the future are unlikely to parallel the high levels observed in the fifties and early sixties. Rather, it is believed that fluctuations of small amplitude around values below the replacement level and within a fairly narrow range are more likely.

Fertility assumptions developed by Statistics Canada and other statistical agencies provided some perspective and helped in assessing the direction and scope of the proposed range of assumptions. The fertility assumptions used in the three scenarios, along with historical trends, are presented in the chart below.

In the reference scenario, the TFR is assumed to increase slightly from 1.48 to 1.53 children per woman by 2011, as younger women's fertility rates slowly stabilize and those of older women keep increasing. After 2011, the TFR is projected to remain constant to the end of the projection period.

In the low-growth scenario, the downward fertility trend is assumed to continue until the TFR reaches 1.3 children per woman at the end of the period.

In the high-growth scenario, a reversal of the downward fertility trend is assumed. The fertility level increases gradually to 1.75 children per woman by the end of the projection period.

#### Fertility Assumptions at the Census Division Level

The Total Fertility Rate in each Census Division varies, ranging from a high of 2.22 in Kenora to a low of 1.32 in Greater Sudbury (2001). A study of the evolution of the TFR in each Census Division over the past ten years shows no convergence of TFRs. For this reason, the projected Pearsonian curve parameters for fertility at the Census Division level are modelled to maintain the regional differences in women's fertility behaviour. The Census Division-to-province ratio for mean age at childbirth in the most recent period is assumed to remain constant in these projections. The variance and skewness of fertility distributions at the Census Division level evolve over the projection period following the same absolute changes as these parameters at the Ontario level.

## **Mortality**

The projected number of deaths each year is obtained by applying age-specific mortality rates to population cohorts in corresponding ages. A method of mortality projection proposed by Lee and Carter in 1992 (see Ronald D. Lee and Lawrence R. Carter, 1992, "Modeling and Forecasting U.S. Mortality," Journal of the American Statistical Association 87(419): 659-671) was used to generate the annual age-sex specific mortality rates for each year of the projections.

The Lee-Carter model starts with the singular value decomposition of a matrix of age-specific death rates from the 1971-72 to 2002-03 period into: (1) the trend in mortality change over time; and (2) the trend in mortality change at each age. The mortality trend over time obtained from the decomposition analysis is extended to the projection period by the use of an autoregressive integrated moving average (ARIMA) model. The relative rate of change at each age taken from the historical trend is then incorporated with the projected mortality trend to derive the agespecific mortality assumptions for the projection period. This process is conducted for males and females separately.

For low-and high-growth scenarios, assumptions of life expectancy at birth at the end of the projection period are first developed. The assumptions for intervening years are set by linear interpolation. The derived set of assumptions for the three scenarios for the province as a whole all reflect a continuation of the improvement (gains) recorded in the average duration of life.

The province of Ontario has one of the highest levels of life expectancy in Canada and among the countries of the developed world. Currently, a newborn female in Ontario can expect to live 82.2 years and a newborn male, 77.7 years. Over the last decade, average gains in life expectancy have been in the order of 0.12 year per annum for females and 0.25 year for males.

Over the 1971-72 to 2002-03 period, gains in life expectancy have been getting somewhat smaller and it is expected that future improvements will continue at this slowing pace. Gains in life expectancy will be concentrated at older ages and are expected to be smaller for infants.

In the reference scenario, life expectancy in Ontario increases gradually from its recent levels to reach 82.6 years for males and 85 years for females by 2031. This means total gains of 4.9 years for males and 2.8 years for females between the beginning and end of the projections.

In the low-growth scenario, life expectancy increases at a slower pace, to 80.9 and 83.6 years for males and females respectively.

In the high-growth scenario, life expectancy reaches 84.5 and 86.3 years for males and females respectively.

Life Expectancy, Ontario									
	1976	1986	1996	2006	2016	2026	2031		
Male									
At Birth	70.8	73.8	75.9	78.9	80.5	81.9	82.6		
At Age 40	33.7	35.8	37.6	39.9	41.2	42.6	43.2		
At Age 65	13.9	15.0	16.1	17.5	18.5	19.5	19.9		
Female									
At Birth	78.0	80.0	81.3	83.2	83.8	84.6	85.0		
At Age 40	39.9	41.3	42.4	43.7	44.3	45.0	45.4		
At Age 65	18.2	19.2	19.9	20.5	20.9	21.4	21.7		

Source: Statistics Canada, 1976-1996, and Ontario Ministry of Finance projection assumptions (Reference Scenario).

Under each of the three mortality assumptions, male life expectancy is expected to progress at a faster pace than female life expectancy. This is in line with recent trends where males have been "catching up," that is, they have recorded slightly larger gains than females. Thus, the overall gap between males and females has diminished, and is projected to continue to do so.

#### **Mortality Assumptions at the Census Division Level**

At the Census Division level, the mortality assumptions were developed using a ratio methodology. The Ontario-level mortality structure was applied to each Census Division's age structure over the past three years and the expected number of deaths was computed. This was then compared to the annual number of deaths for each Census Division over this period to create ratios of actual to expected number of deaths. These ratios were then multiplied by provincial death rates to create death rates for each Census Division, which were then applied to the corresponding population to derive the number of deaths for each Census Division.

An analysis of the ratio of actual to expected deaths for each Census Division did not reveal a consistent pattern or movement toward a convergence or divergence among regions over time. For this reason, the recent three-year average ratio for each Census Division was held constant over the projection period.

# **International Migration Immigration**

Immigration has been a very important contributor to population growth in Ontario. From 1994 to 2004, a total of 1,211,000 immigrants came to Ontario. This represents 55 per cent of all immigrants to Canada in that period.

Immigration levels or targets in Canada are determined by federal government policy. Each year, the federal Minister of Citizenship and Immigration announces the level of immigration to be achieved in the coming year. For the calendar years 2004 and 2005, the Canadian target was set at 220,000 to 245,000 immigrants. In Census years 2000-01 and 2001-02, Canadian immigration exceeded the targets at that time with over 250,000 arrivals each year. In the Census year 2003-04, the most recent year of data, Canada received 239,000 immigrants and Ontario 128,000.

The large immigration fluctuations observed in the past, the fact that immigration targets are set by the federal government, and the fairly stable share of immigrants to Canada settling in Ontario are all factors that were taken into account in establishing the range of immigration assumptions for the future, presented in the chart below.

In the reference scenario, the Ontario immigration level is set at 125,000 for the whole projection period. This level is a little higher than the annual average number of immigrants to Ontario over the last ten years.

The immigration level is set at 90,000 in the low-growth scenario and at 150,000 in the high-growth scenario. These levels are held constant for the whole projection period.

The range between the upper bound of 150,000 immigrants per year in the high scenario and the lower bound of 90,000 per year in the low scenario reflects the large fluctuations in immigration observed in the past. For instance, in the period 1986-91, immigration to Ontario averaged 96,000 per year but in the following five-year period, it climbed to 126,000 per year on average.

As a percentage of the Ontario population, the reference scenario immigration assumption corresponds to 1.0 per cent, the low assumption to 0.7 per cent and the high assumption to 1.2 per cent of the population of Ontario in 2004-05. This compares to 1.1 per cent over the last 10 years. At the end of the projection period, the reference scenario assumption of 125,000 immigrants per year would correspond to 0.8 per cent of the projected Ontario population. This compares to 0.6 per cent for the low and 0.8 per cent for the high scenario assumptions.

#### **Immigration Assumptions at the Census Division Level**

Projected immigration shares for each Census Division were based largely on the distribution of immigrants by Census Division in the recent past. For most Census Divisions, the shares remain constant throughout the projection period. The recent age-sex distribution pattern for immigrants was also assumed to remain constant.

#### **Emigration**

Total emigration is a measure of net emigration, that is, gross international emigration flow minus returning emigrants, plus the net variation in the number of Ontarians temporarily abroad.

The number of emigrants is difficult to assess with a high degree of accuracy because Canada does not have a complete border registration system. Statistics Canada publishes annual estimates of these flows based on a variety of indirect sources (administrative data files and postcensal surveys).

The level of total emigration from Ontario was about 19,000 in 2001-02. Updated and preliminary estimates of total emigration for 2002-03 and 2003-04 are also about 19,000.

All three scenarios set emigration at 19,000 in 2004-05. Projected population growth over time will generate a larger pool of potential emigrants and for this reason, all three scenarios assume a linearly increasing level of emigration, reaching 30,000 by 2030-31.

## **Emigration Assumptions at the Census Division Level**

Projected shares of emigration for each Census Division were based on the average share each received in the last five years. Recent age-sex distributions were applied and assumed to remain constant.

#### Non-Permanent Residents

Statistics Canada estimates that there were about 182,000 Non-permanent Residents (NPRs) living in Ontario in 2004 (e.g., foreign students, temporary workers, refugee claimants). These foreign residents are included in the base population as they are counted in the Census and the year-to-year change in their total number must be accounted for as a component of population growth. Determining assumptions for this component is a complex task because of the significant year-to-year fluctuations and the transient nature of this group.

Over the past 30 years, Ontario has gained on average 4,000 Non-permanent Residents annually. In the reference scenario, the change in the stock of Non-permanent Residents is set at its 30-year annual average of 4,000 for the 2004-2011 period. The annual gain then decreases gradually to zero by 2030-31, reflecting the significant uncertainty characterizing this component.

In the low- and high-growth scenarios, the change in the stock of Non-permanent Residents is set at 0 and 4,000 per year respectively for the whole projection period.

# Non-Permanent Resident Assumptions at the Census Division Level

Each Census Division's share of Ontario's Non-permanent Residents from the 2001 Census is assumed to remain constant for the whole projection period.

## Interprovincial Migration

Interprovincial migration is a component affected by wide year-to-year fluctuations, often in opposite directions. Although Ontario remains a major province of attraction for migrants from other provinces, trend analysis of the last three decades reveals a mixed pattern of several years of gains followed by several years of losses.

Net interprovincial migration has contributed positively to Ontario's population growth with a total gain of 112,000 migrants over the past 30 years, averaging 3,700 per year. Over the late 1990s. Ontario experienced a period of large gains in net interprovincial migration, with an annual peak of 22,400 in 1999-2000. Since then, annual net gains have gradually decreased; in 2003-04, the balance turned negative with a loss of 8,800.

In the reference scenario, the annual net gain for Ontario is set at zero for the first year and at 5.000 for the rest of the projection period, slightly higher than the average annual gain of the last three decades

The annual net gain in the high-growth scenario is set at 5.000 for the first year and 10.000 thereafter. In the low-growth scenario, a net loss of 5,000 is assumed for the first year, and annual net gains of zero are assumed for the rest of the projection period.

The in-flows corresponding to the long-term net migration levels in the low-, reference and highgrowth scenarios are oo.000, 68,500 and 71,000 respectively. The corresponding out-flows are 66,000, 63,500 and 61,000.

#### Interprovincial Migration at the Census Division Level

Interprovincial out-migration at the Census Division level is modeled using the age-sex-specific rates observed over the 1998 to 2003 period. This means that the level of out-migration from each Census Division is affected over time by its age structure.

The level of interprovincial in-migration to each Census Division is held constant throughout the projection period. The interprovincial in-migration level to Ontario for each year of the projection period is distributed among Census Divisions according to the average of each Census Division's share of Ontario's total interprovincial in-migration over the 1998 to 2003 period.

## **Intraprovincial Migration**

At the Census Division level, intraprovincial migration or the movement of population within the province is a significant component of population growth. This component affects population growth only at the Census Division level. At the Ontario level, intraprovincial movements net out to zero.

The annual number of intraprovincial migrants in Ontario has fluctuated within the 350,000 to 450,000 range over the past 15 years. In 2002-03, the last year of revised data, there were 427,000 intraprovincial migrants in Ontario. Over the projection period, the annual number of intraprovincial migrants increases gradually from 417,000 in 2004-05 to 463,000 in 2030-31. Since the Ontario total is not projected per se (it is the sum of all movements among Census Divisions), this increase over time is entirely due to population growth and age structure changes at the Census Division level.

# Intraprovincial Migration at the Census Division Level

The projected number of people by age leaving each Census Division for each year of the projections, as well as their destination within the province, is modelled using the average of 1998-99 to 2002-03 origin-destination migration rates by age for each Census Division. Because migration rates by age group are different for each Census Division and because different age groups have different origin-destination behaviours, the methodology provides a powerful tool to project movers based on observed age and origin-destination migration patterns. The modelling is dynamic, taking into account the annual changes in age structure within Census Divisions.

While intraprovincial migration rates for the population as a whole vary from year to year, the relative distribution by age is fairly stable. However, the evolution of intraprovincial migration patterns in each Census Division was studied to identify specific trends and the intraprovincial migration rate assumptions were adjusted to account for these trends.
